Abstracts

Temporary bonding and debonding systems are technologies used in the semiconductor manufacturing process to temporarily bond a thinned wafer onto a rigid carrier substrate for further processing, and then to debond it after the processing is complete. Temporary bonding is necessary for advanced packaging technologies, such as 3D ICs (Integrated Circuits), wafer-level packaging, and system-in-package, where thinned wafers need to be transferred to different processing tools without damaging them. Temporary bonding systems use adhesives or other materials to bond the thinned wafer to a carrier substrate, which allows for handling, processing, and testing of the wafer. Debonding systems are used to remove the thinned wafer from the carrier substrate without damaging it or its features. The debonding process can use mechanical, thermal, or chemical methods depending on the materials and adhesives used in the temporary bonding process.

The global Temporary Bonding And Debonding Systems market size was estimated at USD 380.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
