Report Overview

A Temporary Spacer for Knee Joint is a medical device specifically designed to provide temporary support and stability to the knee joint following a knee replacement surgery or in cases where an infection has been detected. This device is inserted into the knee joint space to maintain the joint's integrity and prevent the collapse of the joint while the infection is being treated or while awaiting a permanent knee replacement. The temporary spacer is typically made from materials such as antibiotic-laden bone cement or a combination of materials that can provide structural support and deliver antibiotics directly to the site of infection. It serves as a bridge between the initial surgery and the subsequent definitive treatment, allowing for the joint to be preserved and functional during the interim period.
