Report Overview

Tenofovir Disoproxil Fumarate (TDF) is an active pharmaceutical ingredient used in the formulation of antiviral medications, primarily for the treatment of Human Immunodeficiency Virus (HIV) and Hepatitis B Virus (HBV) infections. As a prodrug, TDF is converted into its active metabolite, tenofovir, within the body. This active metabolite inhibits the activity of viral reverse transcriptase, a key enzyme required for viral replication. By doing so, it prevents the integration of viral DNA into the host's genome, thereby suppressing viral replication and reducing the viral load in the patient's body. TDF is valued for its high efficacy, low resistance profile, and favorable safety profile, making it a critical component in various combination antiretroviral therapies.
