Report Overview

A terahertz probe is a tool or device used to detect and measure electromagnetic waves in the terahertz frequency band (1 terahertz = 10^{12} Hz). The terahertz frequency band is between microwave and infrared, has special electromagnetic wave characteristics, and has unique sensitivity to the structure, properties and dynamic processes of matter. Terahertz probes usually consist of the following parts: Terahertz emission source: It generates electromagnetic wave radiation in the terahertz frequency band. Commonly used emission sources include terahertz lasers, terahertz antennas, etc. Terahertz detector: A device that receives and measures the intensity and other properties of terahertz waves. Common terahertz detectors include terahertz antennas, terahertz detector arrays, and the like. Acquisition and measurement equipment: equipment for recording and analyzing terahertz signals, such as terahertz time-domain spectrometers, terahertz imaging equipment, etc. Terahertz probes can be used in many application fields, including materials science, chemistry, biomedicine, security detection, etc. Since terahertz waves can penetrate many non-metallic and non-transparent substances, it can provide information about the internal structure and composition of substances, thus having potential advantages in materials analysis and imaging. In addition, terahertz radiation has no risk of ionizing radiation, so it also has important application prospects in the fields of biomedicine and safety detection.
