Report Overview

The Tetanus Vaccine is a biological product designed to protect individuals from tetanus, a serious bacterial infection caused by *Clostridium tetani*. This vaccine contains inactivated forms of the tetanus toxin, which stimulates the body's immune system to produce antibodies against the toxin without causing the disease. Tetanus vaccines are typically administered in combination with other vaccines, such as diphtheria and pertussis, as part of a routine childhood immunization schedule. The vaccine is also recommended for adults, particularly those at higher risk of exposure to the bacteria, such as through injuries or certain occupational hazards. Regular booster shots are necessary to maintain immunity, as the protection provided by the vaccine decreases over time.
