Report Overview

Tetraethylammonium bicarbonate (TEAB) is a quaternary ammonium salt primarily used as a buffering agent, phase-transfer catalyst, and electrolyte in electrochemical applications, particularly in organic synthesis and analytical chemistry. Its role as a volatile salt makes it valuable in mass spectrometry and high-performance liquid chromatography (HPLC) for ion-pairing purposes, where it aids in the separation and detection of polar compounds. The compound's unique properties, including its solubility in both organic and aqueous media, position it as a niche but critical reagent in pharmaceutical research, material science, and battery technology. Demand is driven by advancements in drug development, renewable energy storage solutions, and analytical instrumentation, though market growth is tempered by the availability of alternative reagents and regulatory constraints on quaternary ammonium compounds. Key suppliers cater to specialized laboratories and industrial R&D sectors, with pricing influenced by purity grades and supply chain dynamics in the fine chemicals industry.
