Report Overview

Tetrahydrocurcuminoids (THC) are a class of chemical compounds derived from the curcuminoids found in the popular spice turmeric, which is obtained from the rhizomes of the *Curcuma longa* plant. These compounds are formed through a reduction process that converts the double bonds in the curcumin molecule to single bonds, resulting in a more stable and potentially more bioavailable form of curcumin. THCs are of interest in the field of natural product chemistry and pharmacology due to their potential health benefits, which may include anti-inflammatory, antioxidant, and neuroprotective properties. Research on THCs is ongoing, with studies exploring their effects on various biological systems and their potential applications in the prevention and treatment of diseases such as cancer, neurodegenerative disorders, and inflammatory conditions.
