Report Overview

A Thermal Evaporation Source is a specialized equipment used in the field of thin film deposition, particularly in vacuum chambers. It is designed to heat and evaporate materials, such as metals or organic compounds, to create a vapor that condenses on a substrate to form a thin film. The product typically consists of a crucible, which holds the material to be evaporated, and a heating element that can reach high temperatures, often exceeding 1000°C. This heating element can be made from materials like tungsten or molybdenum filaments, or resistance heaters, ensuring efficient and controlled heating. The crucible is often made from materials with high thermal stability and low reactivity, such as boron nitride or pyrolytic boron nitride, to prevent contamination of the evaporated material. The Thermal Evaporation Source is crucial for applications in various industries, including electronics, optics, and materials science, where precise control over film thickness and composition is required.
