Abstracts

Thermal imaging night vision telescope is a device that uses infrared detection technology to observe in low-light or no-light conditions. It does not rely on visible light, but forms images by capturing infrared radiation (heat) emitted by objects. This means that thermal imaging telescopes can be used at night or in other low-light environments, and can even see through smoke and other visual obstructions. Thermal imagers can detect and identify targets more easily than traditional night vision devices because they display temperature differences rather than relying on light reflections.

The global Thermal Imaging Night Vision Telescope market size was estimated at USD 325.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
