Report Overview

Thermal recording paper, also known as thermal paper or heat-sensitive paper, is a type of specialty paper that undergoes a chemical reaction when exposed to heat. This reaction causes the paper to change color, typically from white to black or dark blue, allowing for the creation of a visible image or text. The paper is coated with a layer of chemicals, including a colorless or light-colored dye and a developer that reacts with the dye when heat is applied. This technology is commonly used in receipt printers, credit card machines, and other point-of-sale systems due to its ability to produce a quick, clear, and permanent record without the need for ink or toner. The quality of thermal paper can vary, with factors such as sensitivity to heat, durability, and resistance to fading affecting its performance and longevity.
