Report Overview

A Thermocouple Assembly is a temperature measurement device that consists of two different metal wires (thermopiles) joined at one end to form a junction. This junction is placed in the environment where temperature needs to be measured. The other ends of the wires are connected to a measuring instrument, typically a thermocouple thermometer or a data logger. The principle of operation is based on the Seebeck effect, where a voltage is generated at the junction when there is a temperature difference between the two ends of the wires. This voltage is proportional to the temperature difference, allowing for accurate temperature measurement. Thermocouple assemblies are widely used in various industries such as manufacturing, food processing, and scientific research due to their ability to measure high temperatures, resistance to corrosion, and durability.
