### Report Overview

Thermoplastic closed-cell foam is a lightweight, versatile material characterized by its cellular structure, where individual cells are completely sealed off from one another, providing excellent insulation, buoyancy, and shock absorption properties. These foams are typically made from polymers like polyethylene, polypropylene, or ethylene-vinyl acetate (EVA), which can be melted and reshaped multiple times without significant degradation, making them recyclable and adaptable for various applications. The closed-cell structure offers resistance to water, chemicals, and moisture, enhancing durability in demanding environments such as construction, automotive, marine, and packaging industries. Its thermal and acoustic insulation capabilities, combined with flexibility and ease of fabrication, make it a preferred choice for gaskets, protective padding, flotation devices, and insulation panels. The material's ability to balance performance with cost-effectiveness has driven its adoption across both industrial and consumer markets.
