Report Overview

Thermosetting Phenolic Resin is a type of synthetic polymer resin that undergoes a chemical change when heated, resulting in a permanent, three-dimensional network structure. It is derived from the reaction of phenol and aldehyde, typically formaldehyde, and is characterized by its excellent heat resistance, dimensional stability, and chemical resistance. This resin is widely used in various applications, including adhesives, laminates, molding compounds, and coatings, due to its ability to retain its properties under high temperatures and its resistance to degradation from environmental factors. The thermosetting nature of phenolic resin means that once it has been cured, it cannot be remelted or reshaped, making it a valuable material for applications requiring durability and long-term performance.
