Report Overview

The thoracic trocar catheter is a specialized medical device designed for minimally invasive procedures involving the thoracic cavity, primarily used for draining air or fluid from the pleural space in conditions such as pneumothorax, pleural effusion, or hemothorax. It typically consists of a sharp trocar needle encased within a flexible catheter, allowing for precise insertion into the chest wall with minimal trauma. Once positioned, the trocar is removed, leaving the catheter in place to facilitate continuous drainage or aspiration. The device is valued for its efficiency in emergency and critical care settings, reducing the need for more invasive surgical interventions. Its design prioritizes patient safety, ease of use, and compatibility with closed drainage systems, making it a critical tool in thoracic surgery, pulmonology, and emergency medicine.
