### Report Overview

A Thorium-Based Molten Salt Reactor (T-MSR) is a type of advanced nuclear reactor that utilizes thorium as its primary fuel source, rather than the more commonly used uranium or plutonium. This innovative reactor design employs a molten salt coolant, which not only serves as a heat transfer medium but also dissolves the thorium fuel within it. The T-MSR operates at high temperatures, which enhances its thermal efficiency and allows for the generation of electricity through a closed-loop Brayton cycle. The use of thorium offers several advantages, including a more abundant and sustainable fuel supply, reduced nuclear waste, and increased safety due to the lower risk of meltdowns. Additionally, T-MSRs have the potential to breed fissile material from thorium, which can further extend the fuel cycle and contribute to a more sustainable nuclear energy future.
