### Report Overview

A through beam photoelectric sensor is a sensor that actuates an electrical switch/outputs a signal when a light beam is detected. They consist of two separate units, transmitter and receiver. Through-beam sensors detect and count small parts, detect the edges of objects and monitor passages in systems. The emitter and receiver are housed in separate housings according to the through-beam mode. The sensor switches as soon as an object interrupts the laser light, red light or infrared light.
