Report Overview

Thulium-doped laser gain media is a specialized type of laser material that utilizes thulium ions as the active dopant. Thulium is a rare earth element with unique electronic properties that enable it to efficiently absorb and emit light at specific wavelengths, particularly in the infrared region. This product is typically used in high-power laser systems due to its ability to provide high gain and good thermal stability. The thulium ions are incorporated into a host material, such as a glass or crystal, which serves as the gain medium for the laser. This combination allows for the efficient conversion of pump light into laser emission, often at wavelengths around 2 μm , which is valuable for various applications including medical procedures, industrial processing, and scientific research. The performance of thulium-doped laser gain media is characterized by parameters such as absorption and emission cross-sections, fluorescence lifetime, and quantum efficiency, which determine the laser's output power, efficiency, and beam quality.
