Report Overview

The Tibial Nailing System is a medical device designed for the internal fixation of fractures in the tibia, which is the larger and stronger of the two bones located between the knee and the ankle. This system typically consists of a metal nail, which is inserted into the medullary canal of the tibia, and may include additional components such as screws or plates for added stability. The primary purpose of the Tibial Nailing System is to provide structural support and promote the healing process of the fractured bone. It is used in orthopedic surgery to realign and stabilize the bone fragments, allowing for a more rapid and effective recovery. The system is chosen for its minimally invasive approach compared to other fixation methods, such as plates, and its ability to accommodate the natural load-bearing function of the tibia.
