Report Overview

A Time-Grating Encoder is an advanced optical sensor technology used for precise measurement of angular position and velocity. It operates by employing a grating pattern, which is a series of parallel lines or rulings that are etched or engraved on a surface. When light passes through or reflects off this grating, it creates a series of interference patterns that can be detected by a photodetector. The encoder measures the changes in these patterns over time to determine the angular position and movement of the grating. This technology is particularly useful in applications requiring high accuracy and resolution, such as in robotics, precision machinery, and scientific research, where the precise control and monitoring of rotational motion are critical. The Time-Grating Encoder offers advantages such as high reliability, immunity to electromagnetic interference, and the ability to operate in harsh environments, making it a robust solution for demanding industrial and scientific applications.
