Report Overview

Time of Flight (ToF) Cameras are advanced imaging devices that utilize the Time of Flight technology to capture depth information and create 3D representations of objects or scenes. These cameras work by emitting a light signal, typically an infrared laser, and measuring the time it takes for the light to bounce off an object and return to the camera sensor. The time it takes for the light to travel to the object and back is directly proportional to the distance between the camera and the object. ToF cameras are widely used in various applications such as augmented reality, robotics, autonomous vehicles, and 3D scanning due to their ability to provide accurate depth data and real-time performance. They are known for their robustness in various lighting conditions and their capability to handle complex environments, making them a valuable tool in both consumer and industrial settings.
