Abstracts

Artificial dental implants are not really planted with natural teeth, but through medical methods, the pure titanium metal with high compatibility with human bone is precisely designed and manufactured into a cylinder or other shape similar to the root of a tooth. It is implanted in the alveolar bone of the edentulous area by surgical method. After 1 to 3 months, when the artificial tooth root is in close contact with the alveolar bone, a porcelain crown is made on the artificial tooth root. Dental implants can achieve restoration results that are very similar to natural teeth in function, structure and aesthetics, and have become the preferred restoration method for more and more edentulous patients. Because it is not destructive, dental implants have been recognized by the dental community as the preferred method of restoration of missing teeth.

The global Titanium Artificial Dental Implants market size was estimated at USD 5207.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.25% during the forecast period.
