Report Overview

A titanium-based photocatalyst is a material that harnesses the energy from light, typically sunlight or ultraviolet (UV) light, to drive chemical reactions. The most common and widely studied titanium-based photocatalyst is titanium dioxide (TiO₂). When exposed to light, TiO₂ generates electron-hole pairs that can initiate oxidation and reduction reactions on its surface. This property makes titanium-based photocatalysts highly effective for applications such as environmental purification, where they can break down pollutants, organic compounds, and harmful bacteria in water and air. Additionally, they are used in self-cleaning surfaces, anti-fogging coatings, and in the production of hydrogen fuel through water splitting. The photocatalytic activity of titanium dioxide is influenced by factors such as particle size, crystal structure, and the presence of dopants, which can enhance its efficiency under different light conditions.
