### Report Overview

A titanium dioxide-based photocatalyst utilizes titanium dioxide (TiO<sub>2</sub>) as a material that can accelerate photoreactions upon exposure to light, typically ultraviolet (UV) light. When illuminated, TiO<sub>2</sub> generates electron-hole pairs that can initiate redox reactions, leading to the degradation of organic pollutants, the splitting of water molecules, and the killing of bacteria and viruses. Its strong oxidative power, chemical stability, non-toxicity, and cost-effectiveness make it a widely used material in environmental purification applications, such as air and water treatment, self-cleaning surfaces, and antimicrobial coatings. Advances in nanotechnology have further enhanced the efficiency of TiO<sub>2</sub> photocatalysts by increasing their surface area and modifying their electronic properties, allowing for better utilization of visible light and improved photocatalytic activity.
