Report Overview

Tofacitinib Citrate is a small molecule drug that belongs to the class of Janus kinase (JAK) inhibitors. It is primarily used for the treatment of moderate to severe rheumatoid arthritis in adults, where the response to disease-modifying antirheumatic drugs (DMARDs) such as methotrexate has been inadequate. Tofacitinib Citrate works by inhibiting the JAK pathway, which is involved in the signaling of various cytokines that contribute to inflammation and immune responses. By targeting JAK, the drug reduces the activity of these cytokines, thereby alleviating symptoms and slowing the progression of the disease. It is typically administered orally and is an important therapeutic option for patients with rheumatoid arthritis who do not respond well to traditional DMARDs.
