Report Overview

A Torsionally Flexible Coupling is a mechanical device used in power transmission systems to connect two rotating shafts while allowing for some degree of angular misalignment and accommodating torsional vibrations. It is designed to provide flexibility in the transmission system, reducing stress and wear on the connected components. The coupling typically consists of two hubs, one connected to each shaft, and an elastic element that connects the hubs, allowing for torsional movement. This design enables the transmission of power with minimal loss while maintaining the efficiency and reliability of the system.
