Report Overview

A total inorganic carbon analyzer is an analytical instrument used to measure the concentration of total inorganic carbon (TIC) in water samples. TIC refers to the total amount of all inorganic carbon compounds in a water sample, including bicarbonate ions, carbonate ions, and dissolved carbon dioxide. This instrument typically uses either the combustion method or the acidity method for measurement. The combustion method involves burning the water sample with oxygen, absorbing and detecting the resulting carbon dioxide. The acidity method involves adding acid to convert carbonates in the water sample into carbon dioxide, and then detecting the produced carbon dioxide.
