Report Overview

The Total Knee Replacement System is a comprehensive medical device designed to treat severe knee pain and dysfunction caused by conditions such as osteoarthritis, rheumatoid arthritis, or injury. This system typically consists of various components, including a femoral component that replaces the thigh bone's end, a tibial component that replaces the shin bone's end, and a patellar component that replaces the kneecap. These components are usually made from metal alloys, high-grade plastics, or a combination of both, and are designed to replicate the natural movement of the knee joint. The system may also include additional features such as stems, augments, and jigs to facilitate proper alignment and fit during surgery. The primary goal of a Total Knee Replacement System is to restore joint function, reduce pain, and improve the patient's quality of life by providing a stable and durable artificial joint that mimics the natural knee's movement and load-bearing capabilities.
