Abstracts

Transcatheter heart valve therapies refer to minimally invasive procedures used to treat heart valve diseases, such as aortic stenosis or mitral regurgitation, without the need for open-heart surgery. During these procedures, a collapsible artificial valve is inserted into the heart via a catheter, typically through a blood vessel in the groin or chest. Once in position, the valve is expanded, replacing the damaged or diseased native valve and restoring proper blood flow. These innovative therapies offer significant advantages over traditional surgical approaches, including reduced recovery times, fewer complications, and improved outcomes for patients deemed high-risk or inoperable for conventional surgery.

The global Transcatheter Heart Valve Therapies market size was estimated at USD 10500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
