Abstracts

Transmission Synchronizer Brass Ring is a component used in the transmission system of a vehicle, specifically within the gear synchronizer mechanism. It is typically made of brass, a metal alloy that combines copper and zinc, and is known for its excellent machinability, corrosion resistance, and low friction properties. The synchronizer mechanism is responsible for ensuring smooth and seamless gear changes in a vehicle's transmission. When shifting gears, the synchronizer aligns the rotating speeds of the two gears to be engaged, allowing them to mesh smoothly and without causing damage or excessive wear. The brass ring plays a crucial role in this process by providing a low-friction surface that helps to synchronize the gears and minimize the force required to shift between them.

The global Transmission Synchronizer Brass Ring market size was estimated at USD 180.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
