Report Overview

Trapped Key Interlock Switches are safety devices designed to prevent unauthorized access or operation of machinery or equipment. These switches are typically installed on safety gates, doors, or barriers, and they work by trapping a key inside the switch until certain safety conditions are met. The key can only be removed when the switch is in a safe position, ensuring that the machinery or equipment is not operating while the gate or door is open. The primary purpose of these switches is to enhance workplace safety by preventing accidents caused by unauthorized access or operation of potentially hazardous machinery. They are commonly used in industries such as manufacturing, construction, and mining, where the risk of injury from heavy machinery is high. The design of Trapped Key Interlock Switches may vary, but they all share the fundamental feature of requiring a key to be inserted and turned to enable or disable the machinery, thus providing a physical barrier to access until safety protocols are followed.
