### Report Overview

Tri-n-hexylaluminum (TNHAL) is an organoaluminum compound with the chemical formula  $(C_6H_{13})_3Al$ . It is a colorless, viscous liquid that is soluble in non-polar solvents such as hexane and toluene. TNHAL is primarily used as a cocatalyst in the polymerization of olefins, particularly in the production of polyethylene and polypropylene. It functions by activating the Ziegler-Natta catalyst system, enhancing the efficiency and selectivity of the polymerization process. The compound is also known for its ability to form stable, active catalysts with transition metal compounds, which can lead to the production of high molecular weight polymers with desirable properties. TNHAL is typically synthesized by reacting aluminum metal with n-hexyl chloride or n-hexyl bromide in the presence of a suitable solvent. Due to its reactivity with air and moisture, it is handled under an inert atmosphere to prevent degradation.

In 2024, the global Tri-n-hexylaluminum (TNHAL) market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
