Report Overview

A trichromatic color sorter is a type of sorting machine that uses three primary colors of light (red, green, and blue) to evaluate and sort products based on their color characteristics. This technology is based on the principle that all other colors can be produced by combining these three primary colors in different proportions. Trichromatic color sorters are widely used in the food industry, particularly for sorting agricultural products such as grains, coffee beans, rice, and seeds, as well as in other industries for sorting materials like plastic pellets, minerals, and more. The machine works by illuminating the products with red, green, and blue light and then using sensors to detect the reflected light from each product. Trichromatic color sorters are highly effective because they can differentiate very subtle color variations, which may not be detectable by the human eye. This level of precision allows for the production of high-quality, uniform products, which can enhance market value and meet stringent quality standards.
