Report Overview

Trihexyphenidyl is a centrally acting anticholinergic medication that belongs to the class of drugs known as muscarinic antagonists. It primarily functions by blocking the action of acetylcholine, a neurotransmitter that plays a crucial role in various bodily functions, including muscle contractions and gland secretions. Commonly used to treat symptoms of Parkinson's disease, such as muscle stiffness and tremors, Trihexyphenidyl works by reducing the effects of acetylcholine on the muscarinic receptors in the brain, thereby alleviating the symptoms associated with the condition. It is also prescribed for other conditions that involve excessive secretions or muscle spasms, such as dystonias and certain types of poisoning. As with any medication, it is essential to consider the potential side effects and contraindications, which may include dry mouth, blurred vision, and urinary retention, among others. Trihexyphenidyl should be used under the guidance of a healthcare professional to ensure its safe and effective administration.
