### Report Overview

Tubal ligation, also known as tubal sterilization or "getting one's tubes tied," is a surgical procedure for permanent contraception in women. It involves blocking or sealing the fallopian tubes to prevent the eggs from reaching the uterus, thereby avoiding fertilization by sperm. This procedure is considered a long-term and highly effective method of birth control, with a failure rate of less than 1%. Tubal ligation can be performed through a mini-laparotomy (small incision in the abdomen), laparoscopy (minimally invasive surgery using a thin tube with a camera), or hysteroscopy (a procedure using a thin tube inserted through the vagina and cervix). It is an irreversible procedure, meaning that if a woman wishes to conceive in the future, additional surgeries or treatments may be required to reverse the effects.
