Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Tubular Metal Biliary Stents competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Tubular metal biliary stents are implantable medical devices designed to maintain bile duct patency and ensure smooth bile drainage. These stents are typically made of stainless steel, nickel-titanium alloy (Nitinol), or biodegradable metals, offering strong radial support and a relatively large lumen diameter. They are suitable for long-term or permanent biliary drainage and are commonly used in patients with malignant biliary strictures or those who are not suitable for frequent stent replacement. Some tubular metal biliary stents are coated with drugs to prevent tumor ingrowth or stent occlusion. In 2024, the global sales of tubular metal biliary stents are estimated at approximately 737,000 units, with an average selling price of around USD 735 per unit. Single production line capacity is approximately 8,000-10,000 units per year, and gross margin ranges from 50% to 75%. Upstream suppliers mainly include metal raw material providers, functional coating and drug material suppliers, as well as manufacturers of stent forming, laser cutting, and surface treatment equipment. Downstream, the stents are supplied to hospitals, medical institutions, surgical centers, distributors, and agents. Tubular metal biliary stents are high-value medical devices with relatively slow product iteration cycles, but they require high material quality and manufacturing precision, making them an essential long-term treatment solution for patients with malignant biliary strictures.

The global Tubular Metal Biliary Stents market size was estimated at USD 542.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
