Abstracts

Tumor-Infiltrating Lymphocyte therapy is a form of adoptive cell therapy used in cancer treatment that harnesses the patient's own immune cells to fight tumors. TILs are a type of immune cell that naturally penetrate tumor tissues. In TIL therapy, these lymphocytes are extracted from the patient's tumor, expanded in large numbers in a laboratory, and then reintroduced into the patient after the tumor has been reduced or suppressed, typically following lymphodepleting chemotherapy. TIL therapy has shown promise particularly in the treatment of melanoma and other solid tumors.

The global Tumor Infiltrating Lymphocyte Therapy market size was estimated at USD 1550.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
