Abstracts

Tumor-Infiltrating Lymphocytes (TILs) are a type of immune cell that has migrated from the bloodstream into a tumor or cancerous lesion. These lymphocytes, primarily T cells but also including other types such as B cells, natural killer (NK) cells, and dendritic cells, play a critical role in the body's immune response against cancer. TIL therapy has emerged as a promising cancer treatment strategy, particularly in the field of immunotherapy. This involves isolating TILs from a patient's tumor, growing them in large numbers in a laboratory, and then re-infusing them back into the patient after sometimes augmenting them to enhance their anti-tumor capabilities. The goal is to amplify the immune response against the cancer, leading to tumor regression.

The global Tumor Infiltrating Lymphocyte Til market size was estimated at USD 1250.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.75% during the forecast period.
