Abstracts

The Tuned Mass Damper for Wind Turbine consists of an auxiliary mass which is connected to the main structure by means of springs and damper elements. The intrinsic frequency of the tuned mass damper is essentially defined by its spring constant and a damping ratio determined by the damper. The tuning parameters of the tuned mass damper enable the auxiliary mass to oscillate with a phase shift relative to the motion of the structure. In a typical configuration, the auxiliary mass is suspended below the nacelle of the wind turbine, supported by a damper or friction plate.

The global Tuned Mass Dampers For Wind Turbines market size was estimated at USD 185.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
