Report Overview

A tunnel magnetometer is a sensor that uses the tunnel magnetoresistance effect to measure the strength and direction of the magnetic field. The tunnel magnetoresistance effect refers to the situation where a very thin non-magnetic insulating layer (called a tunnel barrier) is sandwiched between two ferromagnetic layers. Due to the quantum tunneling effect, electrons can tunnel from one ferromagnetic layer to another through the tunnel barrier, and the magnitude of the tunneling current is related to the magnetization directions of the two ferromagnetic layers. The development of tunnel magnetometers has benefited from the progress of nanotechnology and thin film preparation technology, making it possible to prepare high-quality tunnel magnetoresistance devices.
