Abstracts

TSP tunnel geological advance prediction technology is a technical means to predict the geological conditions in front of the tunnel face by using the principle of seismic wave reflection. Specifically, this technology excites elastic waves (seismic waves) in an arranged manner in the tunnel surrounding rock. When these elastic waves propagate in three-dimensional space, they will produce reflection phenomena when encountering interfaces with geological lithology changes (such as structural fracture zones, karst and karst development zones, etc.). These reflected waves are then received by the detectors arranged in the tunnel surrounding rock and input into special instruments for signal amplification, digital acquisition and processing, thereby realizing the prediction of the geological conditions in front of the tunnel face.

The global Tunnel Seismic Prediction Tsp Technology market size was estimated at USD 125.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
