Report Overview

A TVS (Transient Voltage Suppressor) Diode Array is an electronic component designed to protect sensitive electronic circuits from voltage transients or surges. It consists of multiple TVS diodes integrated into a single package, allowing for simultaneous protection of multiple nodes in a circuit. These diodes are made from semiconductor materials and operate on the principle of avalanche breakdown, where they rapidly change from a high-impedance state to a low-impedance state when subjected to excessive voltage. This rapid change diverts the transient energy away from sensitive components, thereby protecting them from damage. TVS diode arrays are commonly used in various applications, including automotive electronics, industrial control systems, and consumer electronics, to safeguard against voltage spikes caused by electrostatic discharge (ESD), power surges, or inductive load switching.

In 2024, the global TVS Diode Array market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
