Report Overview

A two-wire pressure transmitter is a pressure measurement and transmission device that is characterized by being connected to an electrical system by only two wires. It usually consists of sensors and internal circuits. The internal circuit of this pressure transmitter can convert the pressure signal measured by the sensor into a standard signal (such as a current signal or a voltage signal), and then transmit the signal to the receiving end through two wires. Compared with the multi-wire pressure transmitter, the two-wire pressure transmitter has simpler wiring and fewer cable connections, which makes installation and maintenance more convenient. It is often used in applications that require long-distance transmission of signals or limited space, such as remote monitoring systems, industrial automation and building management systems, etc. It should be noted that since only two wires are used to transmit signals, the power supply of the two-wire pressure transmitter is usually provided through the receiving end, so the receiving end needs to have appropriate power supply capabilities. In addition, because signal attenuation or interference may occur when the signal transmission distance is long, the reliability and stability of signal transmission need to be considered when selecting and installing a two-wire pressure transmitter.
