Ultra-High Frequency (UHF) Embedded: UHF embedded refers to the integration of Ultra-High Frequency radio-frequency identification technology into products or devices. UHF RFID systems operate within the frequency range of 860 MHz to 960 MHz, offering longer read ranges (typically several meters) and higher data transfer rates. They are commonly used in scenarios that require reading a large number of tags over longer distances, such as warehouse inventory management, product tracking, and theft prevention.

High Frequency (HF) Embedded: HF embedded refers to the integration of High Frequency radio-frequency identification technology into products or devices. HF RFID systems operate at 13.56 MHz and have shorter read ranges (typically a few tens of centimeters), but they offer stronger penetration and higher security. HF RFID technology is often used in applications that require precise reading and higher security, such as access control, electronic ticketing, and payment systems.

The global UHF and HF Inlays market size was estimated at USD 550.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.00% during the forecast period.
