Abstracts

The Ultrasonic Electrosurgical Unit is a surgical device that uses ultrasonic energy to simultaneously cut and coagulate tissue, rather than electricity or laser energy. The Ultrasonic Electrosurgical Unit enables effective coagulation and safe tissue cutting with relatively little thermal damage. Ultrasonic electrosurgical unit are mainly used to cut or coagulate tissue. The cut and coagulation can be performed using two techniques: monopolar and bipolar. Monopolar technique: this technique uses a single active electrode which will also act as a neutral electrode. It transmits the HF current from the generator. When this electrode comes into contact with the tissue, a high current density is transmitted. It is this high concentration of energy on a small area that achieves the desired effect. The current then flows through the patient's body to the neutral electrode. In this way the electrical circuit is closed. It is suitable for desiccating large tissue masses; but higher risk of electrocution, to reduce this risk it is important that the neutral electrode is correctly applied to the patient; this technique is not compatible with patients with metal implants or pacemakers. Bipolar technique: the HF current arrives through an active electrode and exits through the neutral electrode, without flowing through the patient's body. Bipolar forceps are the most common instrument used for this technique. They allow the active electrode and the neutral electrode to be placed opposite each other. The current flows directly from one tip of the forceps to the other. The neutral electrode has no function here. This technique is safer than the monopolar technique as there is no risk of burning or electrocution for the patient; this technique should be used for patients with pacemakers, but not suitable for desiccating large tissue masses. The market drivers for this product are the increasing prevalence of chronic diseases such as cancer and cardiovascular diseases, the rising demand for minimally invasive surgeries, and the technological advancements in UEUs. The constraints of this product are the high cost of UEUs, the lack of skilled professionals, and the regulatory and safety issues associated with UEUs. The future

opportunities for this product are the development of new and improved UEUs with enhanced features and performance, the expansion of the market in emerging regions such as Asia-Pacific and Latin America, and the innovation of new applications and segments for UEUs.

The global Ultrasonic Electrosurgical Unit market size was estimated at USD 3760.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
