Report Overview

An Underground Grease Separator is a specialized wastewater treatment system designed to remove grease, fats, and oils from sewage and industrial effluent before it enters the sewer system or is discharged into the environment. This product typically consists of a tank that is installed underground, which allows for the separation of grease and oil from water through a combination of settling, skimming, and sometimes mechanical means. The grease and oil float to the top of the tank and are collected in a separate compartment, while the treated water is discharged through an outlet at the bottom. The primary purpose of an Underground Grease Separator is to prevent the clogging of sewer lines, reduce the load on wastewater treatment plants, and protect the environment from pollution caused by grease and oil. These separators are commonly used in commercial kitchens, food processing plants, and other industries that generate significant amounts of grease-laden wastewater.
