## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Underwater Hull Cleaning Robot competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An underwater hull cleaning robot is an autonomous or remotely operated robotic device designed to clean the hulls of ships, boats, and underwater structures. The hull of a vessel is the part that comes into direct contact with water, and over time, it can accumulate marine growth such as algae, barnacles, and other biofouling organisms. This growth can increase drag, reduce fuel efficiency, and impact the vessel's overall performance. Underwater hull cleaning robots are developed to address these issues by efficiently and effectively cleaning the hull without the need for dry-docking or manual intervention. An underwater hull cleaning robot is an autonomous or remotely operated robotic device designed to clean the hulls of ships, boats, and underwater structures. The hull of a vessel is the part that comes into direct contact with water, and over time, it can accumulate marine growth such as algae, barnacles, and other biofouling organisms. This growth can increase drag, reduce fuel efficiency, and impact the vessel's overall performance. Underwater hull cleaning robots are developed to address these issues by efficiently and effectively cleaning the hull without the need for dry-docking or manual intervention. In 2024, global underwater hull cleaning robot production reached approximately 1,084 units, with an average global market price of around US\$ 67,000 per unit. Because the ship has been sailing or anchoring in a highly corrosive seawater and strong adhesion marine biological environment for a long time, it is difficult to perform normal maintenance, causing barnacles, oysters, bryozoans, flower tube polyps, lime worms, seaweed, etc. to be attached to the part below the waterline of the hull. Microorganisms that are difficult to remove, as well as some rust scales and rust spots, etc. This increases the mass of the hull, increases the roughness

of the outer surface, and significantly increases the resistance when moving forward in the water, resulting in a decrease in ship speed and a significant increase in fuel consumption. According to statistics, the annual cleaning cost of the global shipbuilding industry is close to 10 billion US dollars. Therefore, cleaning the biological layer attached to the surface of the ship is very important. It can not only save energy and reduce emissions, extend the docking cycle of the ship, ensure the efficiency of ship transportation, but also reduce fuel consumption and transportation costs from an economic perspective. Low cost and good cleaning effect. Using manual cleaning of ships not only takes a long time, but also requires high costs. The underwater hull cleaning robot is highly intelligent and requires relatively low costs.

The global Underwater Hull Cleaning Robot market size was estimated at USD 72.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.50% during the forecast period.
