Report Overview

An Underwater Motion Capture System is a specialized technology designed to track and record the movement of objects or individuals submerged in water. This system typically employs a set of sensors or cameras that are capable of withstanding aquatic environments to capture data on the subject's motion. The captured data is then processed to analyze and reconstruct the movement in three-dimensional space. Such systems are crucial in various fields, including marine biology for studying the locomotion of aquatic animals, sports training to analyze swimming techniques, and film and gaming industries for realistic animation of underwater scenes. The technology must account for the unique challenges of water, such as light refraction and buoyancy, to provide accurate and reliable motion tracking.
