Abstracts

An Underwater Strand Pelletizing System is a specialized technology used in polymer processing to produce uniform pellets from molten polymer. The system operates by extruding the molten polymer through a die to form continuous strands. These strands are then quenched and solidified by being submerged in a water bath. The water rapidly cools the strands, causing them to harden into solid pellets. Once the pellets are formed, they are cut into uniform sizes, separated from the water, and dried. This method is known for its efficiency and ability to produce high-quality pellets with consistent size and shape. The underwater strand pelletizing system is particularly useful for processing high-temperature or high-viscosity polymers, as the rapid cooling helps preserve the material's properties and reduce thermal degradation. It is commonly used in industries such as plastics manufacturing, chemical processing, and recycling, where precise and reliable pellet production is essential for maintaining product quality and performance.

The global Underwater Strand Pelletizing System market size was estimated at USD 86.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
