### Report Overview

An unheated absolute pressure sensor is a sensor used to measure absolute pressure in the environment. It does not require sensor heating to compensate for the effects of temperature. The measurement principle of the sensor is based on the piezoresistive effect or the capacitive effect, and the absolute pressure in the environment is determined by measuring the pressure change inside the sensor. Non-heated absolute pressure sensors usually have the following characteristics: 1. High accuracy: The sensor uses high-precision measuring elements and sophisticated electronic circuits to provide accurate absolute pressure measurement results. 2. Wide measurement range: The sensor can cover a large pressure range, ranging from a few pascals to several megapascals, and is suitable for the pressure measurement needs of different application scenarios. 3. Temperature compensation: The sensor has a built-in temperature sensor, which can measure the ambient temperature in real time and perform temperature compensation through internal algorithms to improve the accuracy and stability of the measurement. 4. High reliability: The sensor adopts high-quality materials and structural design, has high anti-interference ability and stability, and can operate stably for a long time in harsh environments.
