Report Overview

A unipolar stepper motor is an electrical motor that converts digital steps into mechanical movement. It is characterized by its unipolar winding configuration, where each phase consists of a single coil with a common center tap, allowing for simpler wiring and lower inductance compared to bipolar stepper motors. This type of motor is widely used in applications requiring precise positioning and control, such as in robotics, 3D printers, and CNC machines. The unipolar stepper motor operates by energizing specific coils in a sequence to create a magnetic field that rotates the motor's shaft in small, discrete steps. This results in high torque and smooth, controlled motion, making it an ideal choice for applications where accuracy and repeatability are crucial.
